

A photograph of a forest stream. The water is dark and flows over rocks. The banks are covered in dry, yellowish-brown grass and fallen branches. Several trees with white bark, possibly aspens, stand along the stream. The background shows a rocky hillside with more trees.

# Impacts of LTPBR on Lower Elkhorn Creek

Kate McCarthy, Kyle Robinette,  
Chloe Rogozinski, Lynette  
Schwanger, Taia Storrs

## Background

---

**The Partnership:** Collaborative research between Trout Unlimited, Walton Family Foundation, and the Colorado Water Conservation Board.

**The Problem:** Streams across the west have seen a decline in beaver populations, leading to a loss in surface and groundwater retention, and sediment capture.

# Background

---

## Restoration Strategy:

- "Low-Tech" Process-Based Restoration (LTPBR)
- Beaver mimicry structures (BMS)
- Post-assisted log structures (PALS)

## Study Scope: 6 Colorado Headwater Sites

- Poudre River: **Lower Elkhorn**

# Questions and Objectives

---

**How do LTPBR treatments impact surface and ground water levels?**

**Objective:**

Measure Surface and groundwater levels before and after LTPBR installation.

- Baseline surface and groundwater conditions
- Water levels before and after installation
- Changes in floodplain water storage

# Questions and Objectives

---

**How does the installation of LTPBR structures impact streamflow discharge?**

**Objective:**

Measure streamflow discharge upstream and downstream before and after LTPBR structure installation.

- Reduce peak flows
- Increase drought and wildfire resiliency
- Attract beavers

# Questions and Objectives

---

**How does the installation of LTPBR structures impact river sediment depth and deposition?**

**Objective:**

Measure stream depth every 10 meters along the reach from the upstream sensor to the downstream sensors.

- Compare pre- and post-restoration sediment depths
- Trap sediment → Improve water quality

## Site Location – Lower Elkhorn Creek

## Site Location – Lower Elkhorn Creek – PALSs + BDA

# Site Pictures – Lower Elkhorn Creek

---

**PALS**

**Stage Plate**

**Groundwater Wells**

**Streamflow Transect**

# Methods

**Existing  
Project data**

**One upstream and  
one downstream  
site**

**Discharge (CFS), Stream  
Depth, Groundwater  
Depth, Sediment depth**

**Rstudio Data  
Analysis**

# Objective 1 Results: Groundwater Well Monitoring

# Objective 1 Results: Groundwater Well Monitoring

# Objective 2 Results: Streamflow Discharge

# Objective 2 Results: Streamflow Discharge

# Objective 3 Results: Sediment Depth

Lower Elkhorn Sediment Depth

Stream Characteristic

- |                                                |                                                 |                                                         |
|------------------------------------------------|-------------------------------------------------|---------------------------------------------------------|
| <span style="color: green;">●</span> Above Dam | <span style="color: purple;">●</span> Below Dam | <span style="color: lightgreen;">●</span> Split Channel |
| <span style="color: orange;">●</span> At Dam   | <span style="color: pink;">●</span> Rock        | <span style="color: yellow;">●</span> Streams Converge  |

# Conclusion

- Early signals show PALS are influencing hydrology
- Trends suggest changes in groundwater, flow, and sediment
- Dataset is still short-term
- More time + data needed to confirm effectiveness

# QUESTIONS?

Thank you Kira, Nick, and Joel!
